

FIELD CROP DATA 1919 - 1967

FLORIDA CROP AND LIVESTOCK REPORTING SERVICE

Joe E. Mullin, Agricultural Statistician in Charge
1222 Woodward Street
Orlando, Florida 32803

ACKNOWLEDGEMENTS

This publication is intended as a historic reference for basic information concerning Florida's field crops. It should be of value to farmers, county agents, service industries and others who are interested in field crop statistics.

It is published by the Florida Crop and Livestock Reporting Service, a cooperative agency of the Statistical Reporting Service, U. S. D. A., Florida Department of Agriculture; and Florida Agricultural Experiment Station. Acreage, production, and value data are official State and U. S. D. A. statistics prepared by the Florida Crop and Livestock Reporting Service.

Many farmers and agricultural industries have voluntarily supplied information used to develop these statistics. Much basic data have been supplied by the Agricultural Stabilization and Conservation Service for crops under U. S. D. A. programs. The cooperation of individuals and agencies is sincerely appreciated.

TABLE OF CONTENTS

	Page
Introduction and Comments	1
 STATE: Acreage, Yield, Production and Value: 1919 - 1967	
Field Crops -- 1966 - 1967	2
✓ Corn	3
✓ Cotton	7
✓ Cottonseed	9
✓ Hay, All	10
Hay, Peanut	9
Oats	11
✓ Peanuts	12
✓ Soybeans	14
✓ Sugarcane	15
Sweetpotatoes	16
✓ Tobacco:	
Type 14	17
Type 45	19
Type 56	19
Type 62 - Florida	20
Type 62 - Ga. - Fla. Combined	21
✓ Wheat	22

COUNTY: Acreage, Yield and Production: 1961 - 1966

Corn	4-6
Cotton	8
Peanuts	13
Soybeans	14
Tobacco -- Type 14	18
Wheat	22

Introduction and Comments

This publication presents an up to date and an historic series of field crop data for the State of Florida. A particular effort has been made to meet the diverse needs and interests of the general public for a reliable reference book on State acreage, production and value, and county acreage and production of major field crops in Florida. Persons needing current data are served by monthly reports based on the latest data this office has available. Being estimates, they are subject to revisions as more current or more complete data become available. Plans call for annual supplements to this bulletin to keep the series current, as well as to provide a medium for publishing revisions.

Crop estimates are designed to help farmers, agricultural agents, research workers, and others in agriculture in keeping abreast of current changes and in appraising future prospects in the light of past experience. It represents a part of the Department's continuing program to provide comprehensive data as a background for making analyses of the different segments of agriculture.

Agriculture is Florida's most important industry and has recorded phenomenal growth in recent years. Farmers are no longer producing for a local market and thus must rely on an external source for production and marketing information. We hope this information will be of use to you in your agricultural operations or business.

* * * * *

The period 1919 to 1967 has seen many changes in Florida's agriculture. Some of these have been permanent but most are only fluctuations resulting from new innovations, technology and, to a certain extent, agricultural policy.

One of the most important newcomers during this period has been the sugarcane industry. Since its introduction in 1928 it has risen to the No. 1 position in value of field crops in Florida. Severing trade agreements with Cuba stimulated a rapid increase in acreage and production beginning in 1961. Two important byproducts of the industry are blackstrap molasses and bagasse. The molasses are used mostly in cattle feed and the major portion of the bagasse is burned to generate power for the sugar mills and the rest is sold to the poultry industry for poultry litter and to other animal industries for bedding and litter. Most of the raw sugar produced in Florida is shipped to refineries in other states for refining.

A high value crop that is very important to the general farmer is Type 14 or flue-cured tobacco. Its

high value per acre and restricted acreage has stimulated the use of highyielding and disease resistance varieties along with a high rate of fertilization and irrigation. A combination of these production practices has more than doubled the yield per acre on most farms. Much of this tobacco is sought for the export trade.

The Type 62 or shade grown cigar wrapper industry is concentrated, because of soil requirements, around Quincy in Gadsden County and extends northward into a small area of South Georgia. A small acreage is also grown in Madison County. Most of this tobacco is utilized by the American cigar industries and the rest is exported.

Cotton acreage in Florida has declined from 319,000 acres harvested in 1911 to a low of 10,700 in 1967. In 1923 the average yield per acre was only 42 pounds compared to 381 in 1967 and the record high of 384 in 1963. The average price and value of Florida's cotton crop was at its peak in 1952 at an average of 38.94 cents per pound and more than 6 million dollars in value. Increasing production costs together with low yields, synthetic substitutes, decreasing exports, and a decreasing labor supply have all contributed to the decline in importance of cotton in Florida.

Field corn has long been the standby of the Florida farmer for livestock rations, and most of the state's corn production is consumed by livestock. This production for farm use and local markets has tended to keep the acreage reasonably stable in the past. The largest acreage in recent years was 809,000 acres planted and 756,000 acres harvested for grain in 1935. Production practices resulted in low yields during the depression period, the record low being 8.0 bushels per acre in 1933 compared with the record high of 50.0 bushels in 1967. Prices were also low at this time, the lowest being \$0.46 per bushel in 1932. This compares with the record high average of \$2.13 per bushel for the 1947 crop of corn. In 1961 Congress authorized a voluntary program designed to stop the build-up of the feed grain stocks that had reached an all-time record high level. Many Florida farmers voluntarily reduced acreage and received Government payments in return. This assisted in reducing stocks and bolstering the prices of corn and other feed grains.

Peanuts have declined in acreage but not in value. It is interesting to note that the record yield per acre and total value was in 1965, and the average price per pound and production in 1965 were second only to 1967 and 1948 respectively. This compares with a low average price of 1.0 cents per pound in 1931 and a low total value of \$289,000 in 1932. The record high harvested acreage, at 115,000 acres, was in 1942 and compares with 49,000 acres in 1967. Total equivalent solid acreage of peanuts was 399,000 in 1942 and 90,000 acres in 1966. "Hogging off" interplanted peanuts and corn was once a common practice in Florida.
